

customnode.CustomBaseNode.build
NodeName

customnode.CustomBaseNode.set
NodeNamesToRootAndEnd

customnode.CustomBaseNode.set
PortNamesToFullHierarchy

type_

```
graph LR; A[customnode.CustomBaseNode.build  
NodeName] --> D[type_]; B[customnode.CustomBaseNode.set  
NodeNamesToRootAndEnd] --> D; C[customnode.CustomBaseNode.set  
PortNamesToFullHierarchy] --> D;
```

The diagram illustrates three method calls from the `customnode.CustomBaseNode` class pointing to a variable named `type_`. The first call is `buildNodeName`, the second is `setNodeNamesToRootAndEnd`, and the third is `setPortNamesToFullHierarchy`. Each call is represented in a white box with a black border, and blue arrows point from each box to the `type_` variable, which is shown in a gray box.
